- Source CSV

`concrete_strength.csv` retains the source header and all 1,030 numerical rows without modifying the measurements. Each row has eight inputs and one measured response. The notebook contains the project's cleaning and split code.

Column, in file order	Role	Unit
Cement	Input	kg/m³
Blast Furnace Slag	Input	kg/m³
Fly Ash	Input	kg/m³
Water	Input	kg/m³
Superplasticizer	Input	kg/m³
Coarse Aggregate	Input	kg/m³
Fine Aggregate	Input	kg/m³
Age	Input	days
Concrete compressive strength	Response	MPa

Prediction-query provenance

`new_samples.csv` contains a numeric `query_id` followed by the same eight input columns in the same order. It has no response column.

Query ID	Construction
1	Inputs from zero-based source row 0
2	Inputs from zero-based source row 16
3	Inputs from zero-based source row 100
4	Inputs from zero-based source row 600
5	Query 1 with Age changed to 500 days

Source-row indices refer to `concrete_strength.csv` before notebook preprocessing and exclude the header. Queries 1-4 are extracts with responses omitted; query 5 is a project-created modification. All other input values are retained.
